The machine
learning
process is:

Iterative

- In both big and small ways

Challenging

- It's rarely easy large amounts of potentially complex data

Often rewarding

- But not always

The First Problem: Asking the Right Question

The first problem you face in the machine learning process is deciding what question to ask
if you ask the wrong question, you won't get the answer you care about

Choosing what question to ask is the most important part of the process

Ask yourself: Do you have the right data to answer this question?

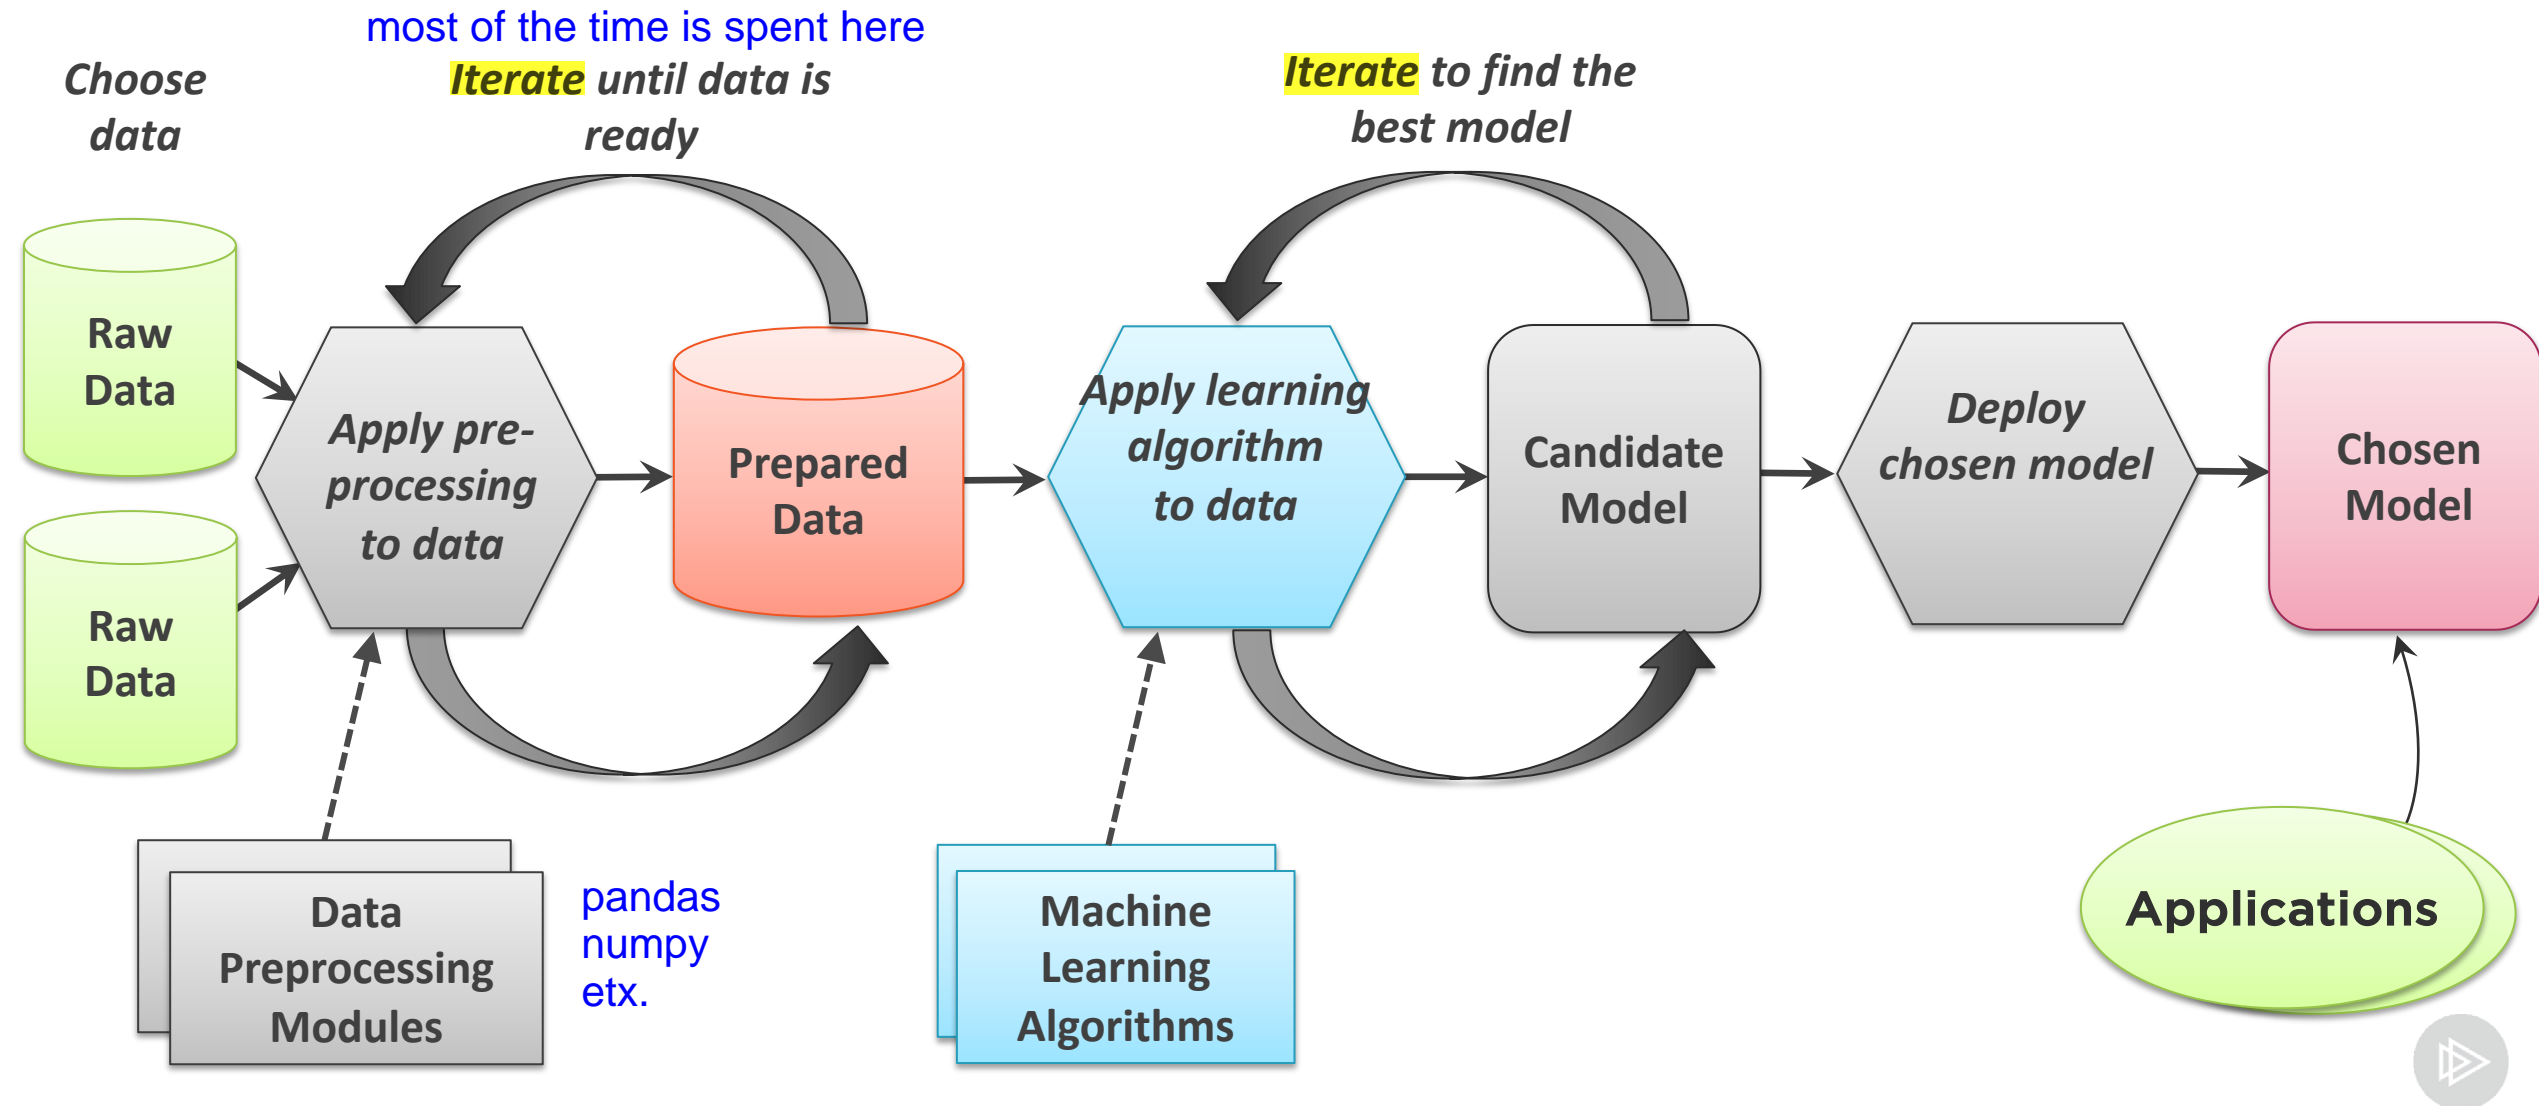

Ask yourself: Do you know how you'll measure success?

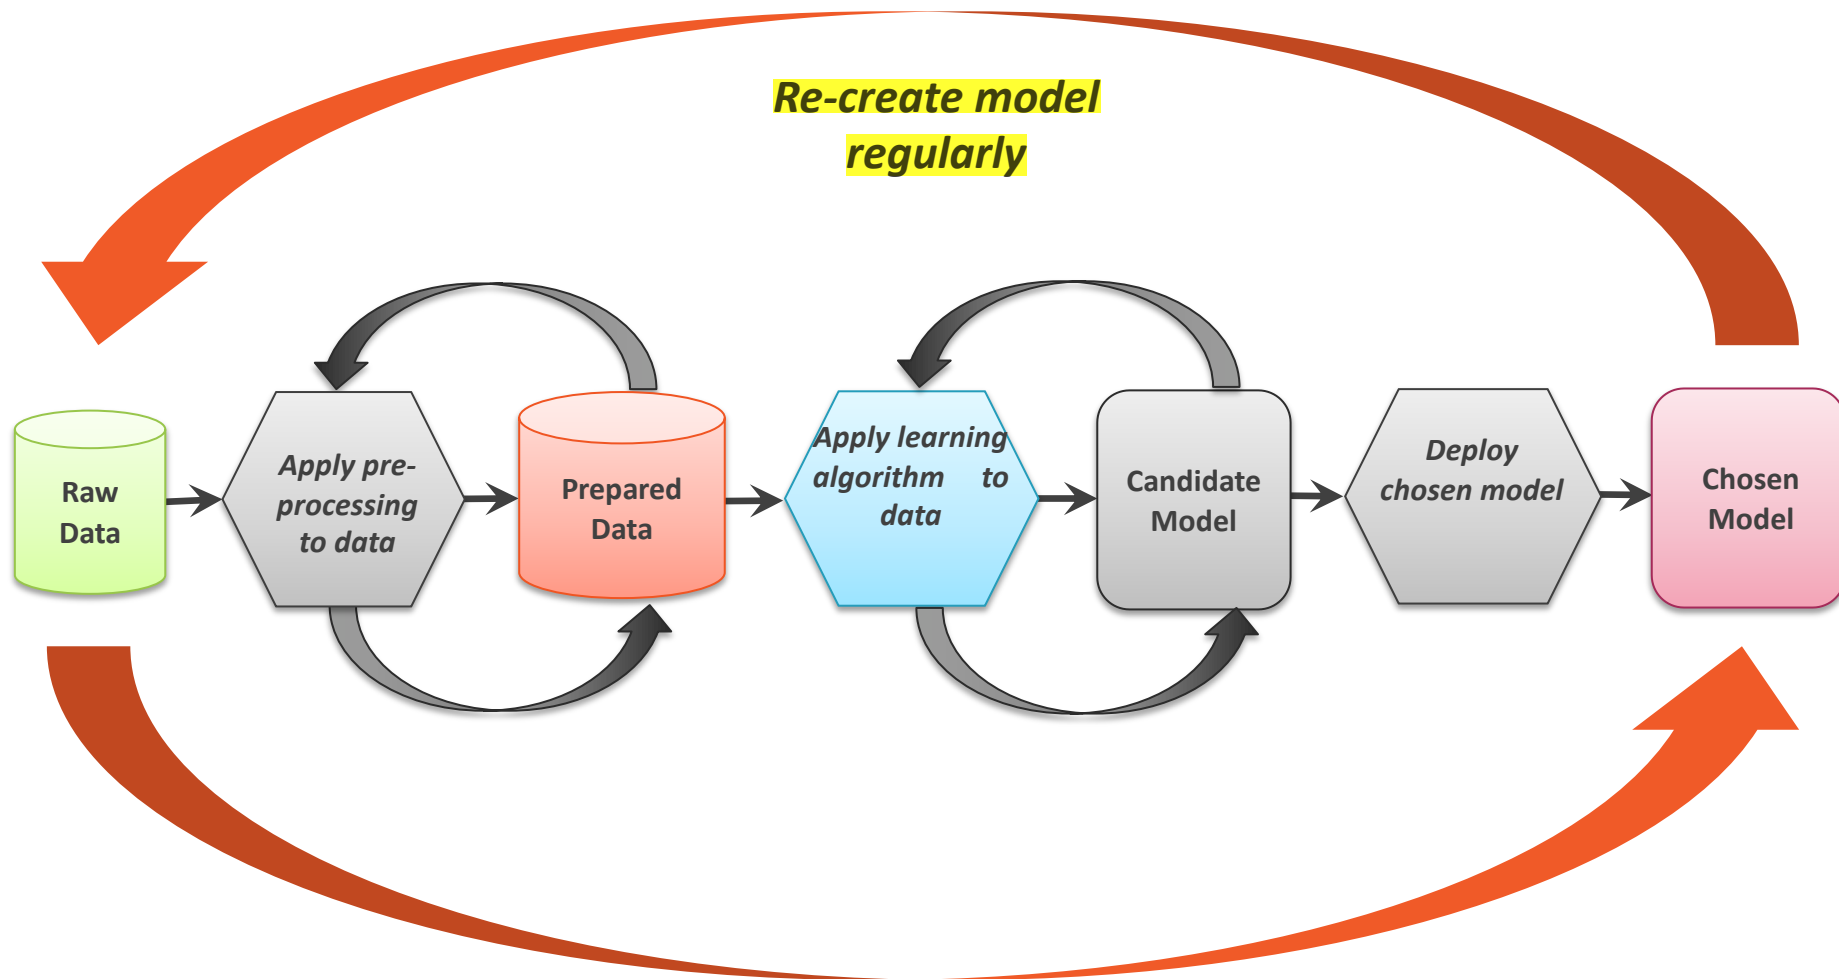

Knowing this up front is important, because if you don't, you will never know when you're done.

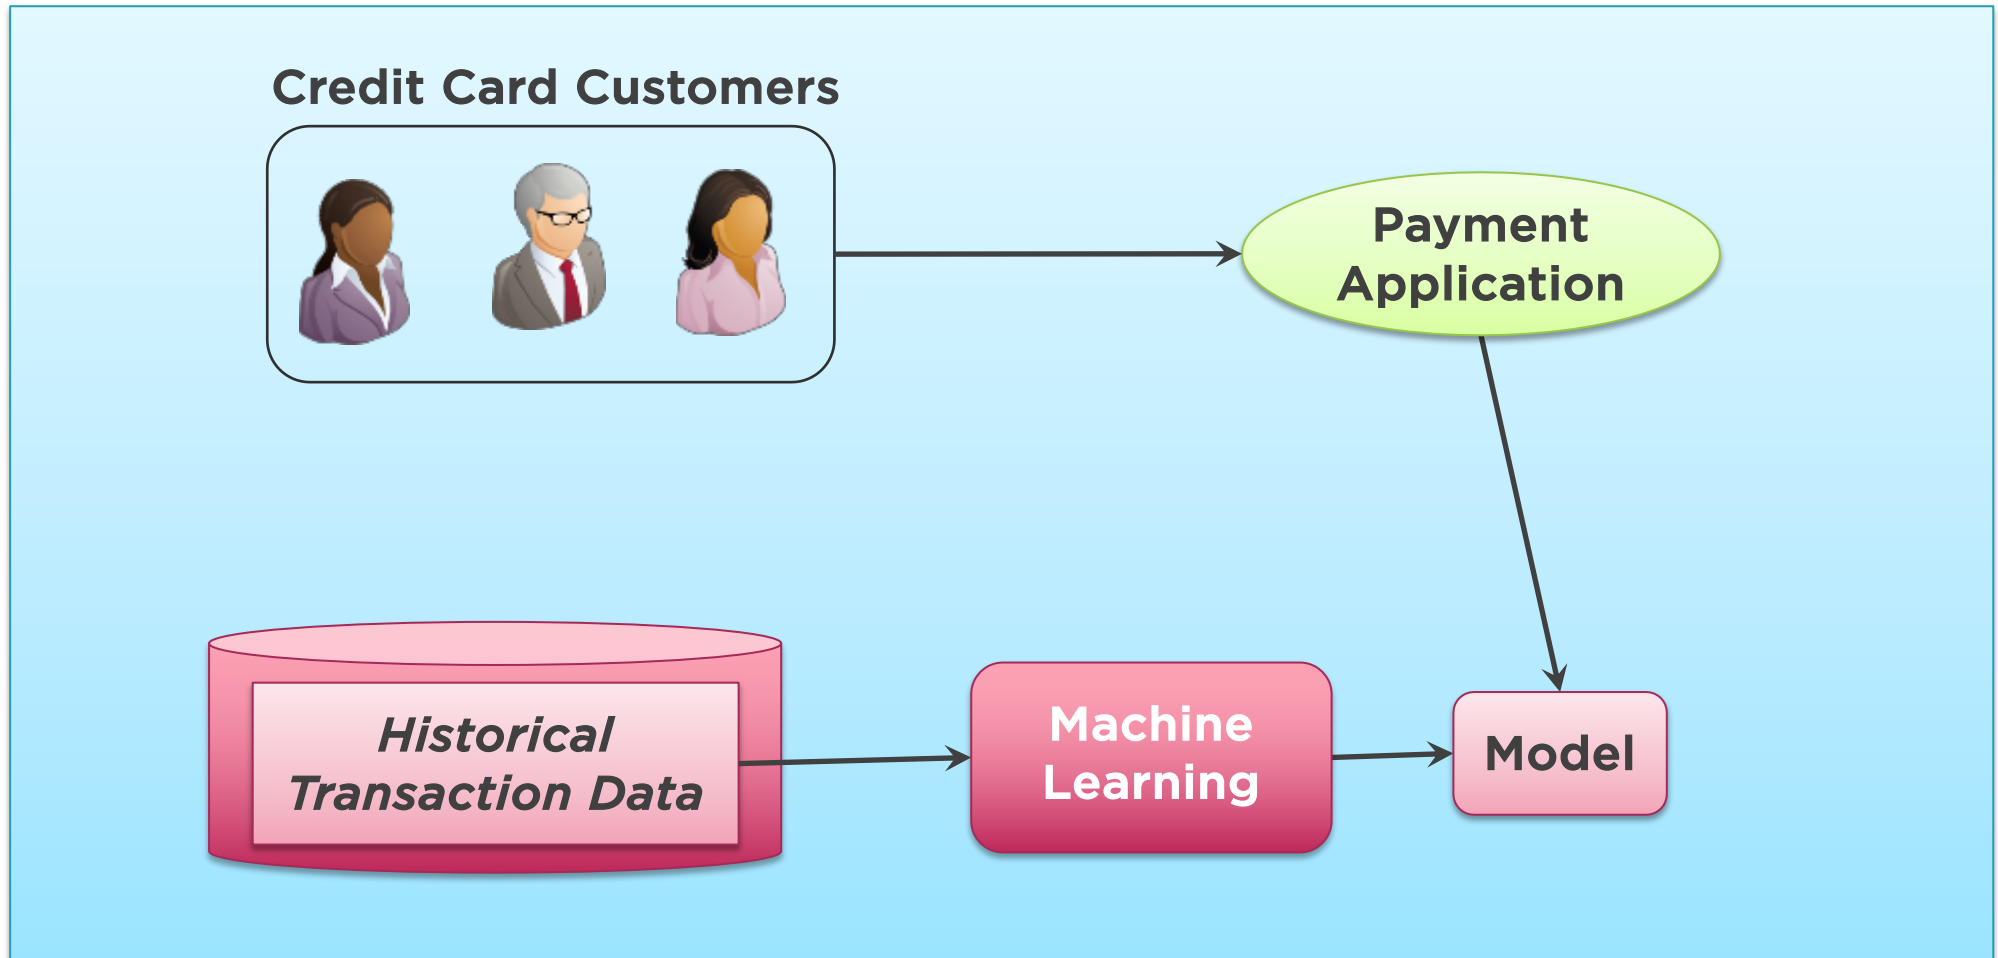

The Machine Learning Process

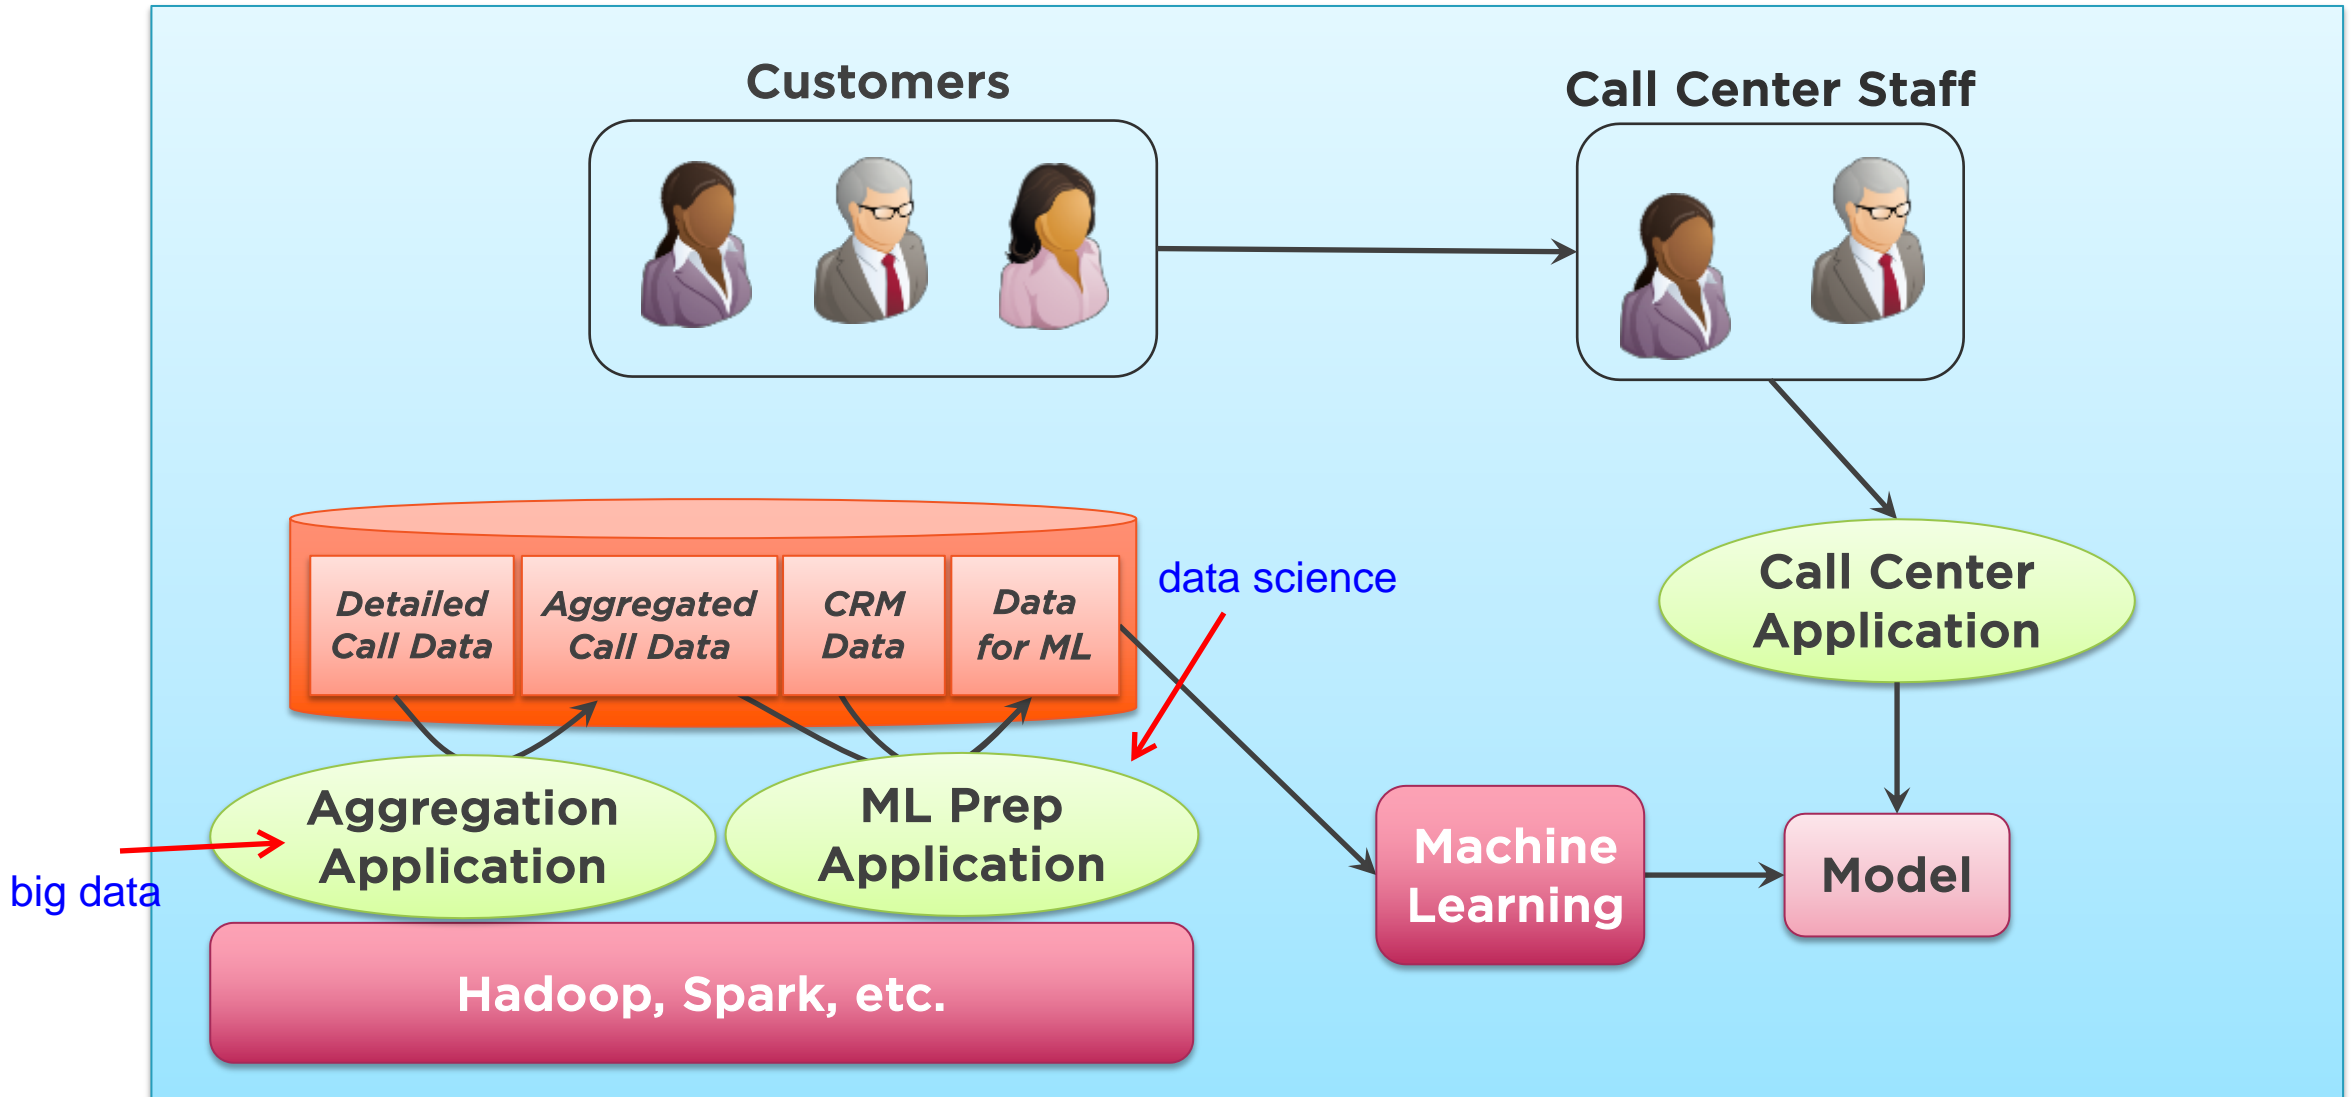

Repeating the Machine Learning Process

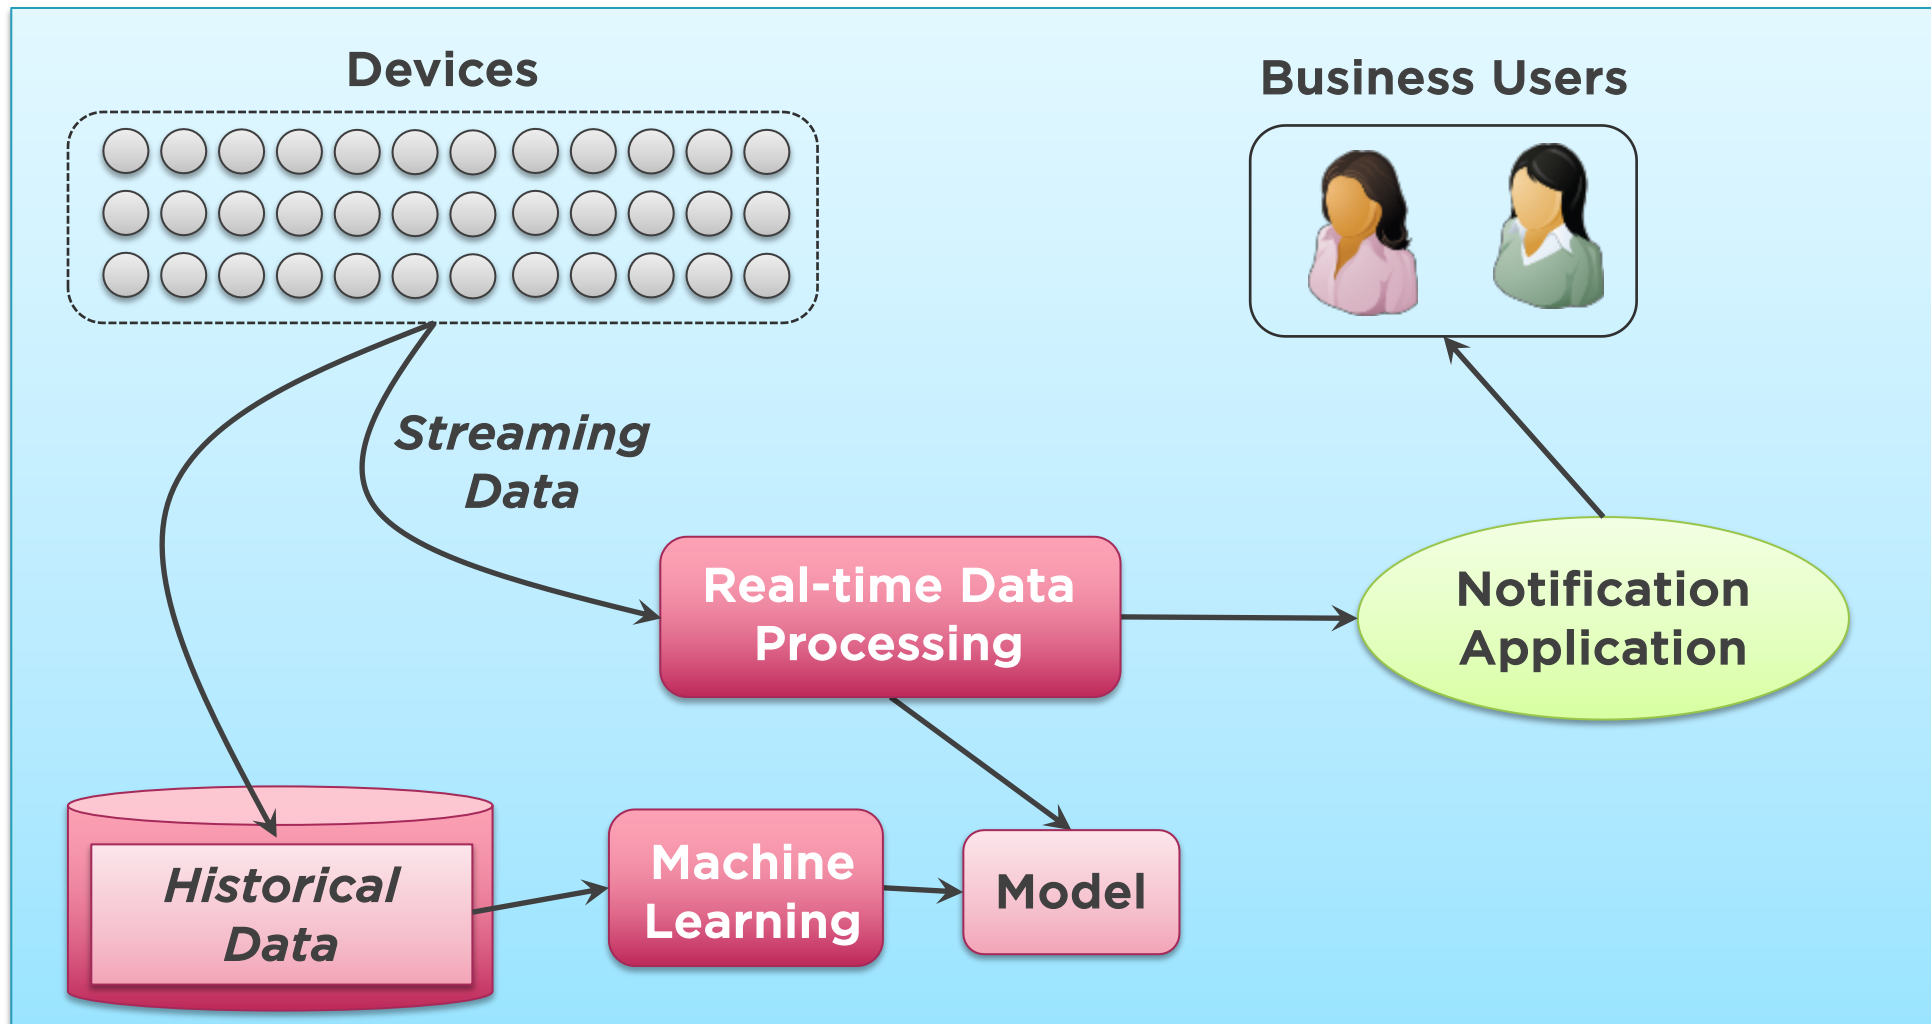

Scenario: Detecting Credit Card Fraud

Scenario: Predicting Customer Churn

Scenario: Predicting Equipment Failure

Other Example Uses

Recommendations

Speech
Recognition

Language
Translation

Facial
Recognition

The main points

Ask the right question

Choose the right data

- And get that data into good shape

Iterate until you have a model that makes good predictions

- And periodically rebuild the model

Deploy the model
